

Telescopic Arm awning

Say goodbye to suburban folding arm style and hello to the most modern incarnation of the lateral arm awning—the **Telescopic Arm** awning.

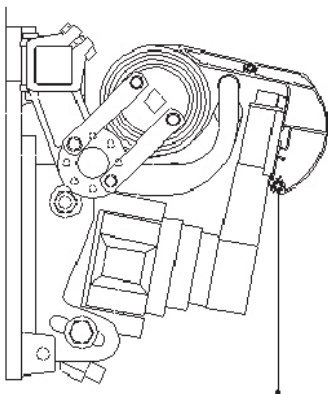

No springs, cables or chains, the telescopic arms use patented gas strut technology from Switzerland to achieve optimum fabric tension.

Where ever you stop the awning, the tension is at its maximum—the same at every point. Only available with electric operation due to the very high tension created by the arms.

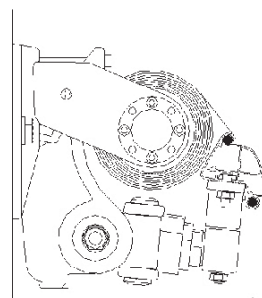

Automate with rain, sun or wind sensors for the total experience.

The arms do not dip like standard folding arms, they provide maximum headroom underneath. The angle of the arms is also shallower than for a folding arm awning for the same fabric angle.

Maximum width is 18 metres and maximum projection is 5 m.
